

# European Residual Mixes

## Results of the calculation of Residual Mixes for the calendar year 2019

Version 1.0, 2020-05-29

### Introduction

The purpose of a Guarantee of Origin (GO) system is to enable consumers to have their say on how electricity is generated by selecting the supplier and power product. For consumers to be able to make informed choices, electricity suppliers must disclose the origin and environmental attributes of sold electricity (IEM Directive (EU) 2019/944, Annex 1 (5)). This is called electricity disclosure.

For power companies to be able to tell their customers anything about the origin of the electricity in today's unbundled, international and complex power market, they need a way to track electricity from production to consumption. The main tracking tool for electricity is the GO (REDII Directive 2018/2001, Art 19). As long as not all consumption is tracked using GOs, a *residual mix* is needed to make the GO a reliable tracking instrument. A country's residual mix represents the shares of electricity generation attributes available for disclosure, after the use of explicit tracking systems, such as GO, have been accounted for. Without a residual mix, renewable electricity sold with GOs would be double counted because the same electricity would be disclosed to consumers buying "regular" electricity.

Due to the international nature of both the electricity markets and tracking systems, the volume of available generation attributes in the domestic residual mix differs from the volume of untracked consumption<sup>1</sup>. Thus, the calculation of residual mixes needs to be centrally coordinated and a common pool for balancing generation attributes must be used. This is achieved via the European Attribute Mix (EAM), which replaces the deficit of energy origin caused by exported GOs. EAM acts as an "equalising reservoir" for generation attributes for national residual mixes. After the attribute balancing via the EAM the volume of available generation attributes in the residual mix is equal to the untracked consumption in every country. *This is a precondition for the GO to be a credible tracking instrument in the context of international trading.*

Residual mix is only needed when consumption is partially explicitly tracked. In so-called "full disclosure domains" residual mix is not needed because all consumption is covered by cancelled GOs. Austria has had a full disclosure system in place since 2017 and hence the residual mix zero. Also, Switzerland has full disclosure regulation but, due to detailed implementation and calculation rules, a residual mix can still be calculated and is included in the results.

Starting from this year, the residual mix calculation methodology has been changed, from Shifted Transaction based method to Issuance based method. The reason for this are the difficulties identified in the earlier method in the current Guarantee of Origin (GO) environment, mainly that international trading activities had direct impact to residual mix.

**Note:** For the revised calculation methodology and results since 2015, please refer to the AIB-website. For additional background information regarding the concept of residual mix calculations and its application please refer to the website of the RE-DISS project <http://www.reliable-disclosure.org>, where you can find the final report of the project, residual mix calculation methodology, results of previous year calculations (up to year 2014) and the RE-DISS Best Practice Recommendations.

<sup>1</sup> Untracked consumption = Electricity consumption for which the energy source is not explicitly disclosed through tracking instruments such as Guarantees of Origin.

Following that, the biggest difference between the methodologies is that Issuance and Expiry volumes are used instead of Import and Export volumes when calculating domestic residual mixes. At the same time, the environmental indicators have been toned down to Direct CO<sub>2</sub> and Radioactive waste, due to difficulties in updating the advanced emission factors and due to IEM Directive ((EU) 2019/944) only requiring these two. For more information refer to methodology revision material on: <https://www.aib-net.org/facts/european-residual-mix>.

The calculation area has been expanded this year with Serbia joining in. Regarding the data sources, the usual production and exchange data sources on ENTSO-E were not available this year. Instead, Eurostat were used as the main production data source and the exchange data were collected from ENTSO-E Transparency platform (instead of Power Statistics used before).

## Description of the Document

The main results of this document are the **European Attribute Mix** (EAM) and the residual mixes for all countries. A wide variety of additional information is also presented as supporting material. The **EAM** (Table 1) is the mix of energy sources and the corresponding environmental indicators that is collected from countries which have surpluses of energy attributes. The EAM is to be used for filling up national residual mixes (calculated by national disclosure competent bodies) in case of a deficit of disclosure attributes. The national surpluses and deficits to/from EAM are shown in Table 3 and Figure 3.

The **national residual mixes** for 32 European countries<sup>2</sup> are shown in the Table 2, Figure 1 and Figure 2. Note that the official residual mixes for each country are in principle published by the respective national authorities. Also note that for countries without recorded explicit tracking, untracked consumption equals the total electricity consumption, and thus the residual mix is applicable for the disclosure of the entire electricity consumption.<sup>3</sup>

Energy sources in the residual mixes are divided in three main categories: renewable, nuclear and fossil, of which renewable and fossil are further divided into subcategories (Table 8). Selected subcategories are based on relevance in terms of volume and perceived consumer importance. The used categorization is also identical to all residual mix calculations since the 2013.

Figure 4 shows the **direct greenhouse gas emissions** as direct CO<sub>2</sub> emissions per kWh of produced electricity. Figure 5 shows the content of **highly active radioactive waste** as mgRW/kWh. Both of these environmental indicators are shown for the European Attribute Mix (EAM), the production mix (PM), the residual mix (RM) and the total supplier mix (TSM) of European countries.

The base data for the direct CO<sub>2</sub>-emissions have been based on the following references: Treyer and Bauer (2013), Dong Energy A/S, Energi.dk, Vattenfall (2010), Fritzsche and Rausch (2009), Bauer (2008) and GEMIS database (GEMIS, 2015). The data for the radioactive waste has been compiled based on BDEW (2014), DECC (2014), the Platts World Database and IAEA PRIS. These indicators reflect the differences in waste rates produced by the types of nuclear power reactors used in the respective countries per kWh of electricity. Due to a lack of detailed data per reactor, the waste rates have been based on estimates of typical data for five major types of reactors used in Europe. However, where available, factors as reported by national authorities are used instead.

**The total supplier mixes** (TSMs) are presented in Table 4, and Figure 6. The total supplier mix represents the total consumption mix of a country, i.e. shares of energy sources in the tracked and untracked part of consumption. Thus, both explicitly tracked and available remaining electricity attributes are included in the TSM, which equals in physical volume with the country's total electricity consumption. The production mixes are shown in Table 5.

The evolution of attributes, on the European scale: how much renewables are in the Production mix, how much of those are left in the residual mix and finally how much renewables are carried on to EAM is shown in the Table 6 and Figure 8.

---

<sup>2</sup> Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Great Britain, Greece, Hungary, Iceland, Ireland (All-Island), Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland

<sup>3</sup> Calculation of the Residual Mix obviously can only take the volumes of explicit tracking systems into account if the respective data is public or known by the authority and respectively being made available to the one who conducts the calculation. This means that explicit tracking systems, for which no statistical data is available to the competent authority and/or AIB, cannot be reflected in the residual mix and are therefore likely to lead to double counting.

The rest of the results are different kinds of **comparisons** between different mixes and different years. Figure 7 present the comparison between the production and residual mix of different countries, and Figure 9 that of production and total supplier mix. Table 7 and Figure 10 show the difference between final residual mixes of 2017, 2018 and 2019.

With the change in the calculation methodology all the results are now from Issuance Based methodology. Furthermore, the Shifted Transaction Based results are not calculated anymore at all. At the same time the environmental indicators have been limited to direct CO<sub>2</sub> emissions and radioactive waste as those are the only ones required in the internal electricity market directive (EU) 2019/944 (Annex 1 (5)). This results report has also been streamlined for easier reading.

**Note:** Any use of the data presented in this document should include a reference to AIB.

**Note:** The calculated country and energy source/technology emission factors forming the base for the National Residual Mix calculations may not be sold, distributed or processed as part of a derivative tool.

#### Disclaimer on data quality:

Because of the 12 months lifetime of GOs, the residual mixes were calculated based on all recorded GO transactions during the assumed time period (1.4.2019 – 31.3.2020) for disclosure of 2019 consumption, irrespective of the underlying production year of these GOs. This ensures that all GO transactions are considered in the calculation.

Volumes which have been explicitly tracked without the use of transparent tracking instruments, e.g. by so-called contract based tracking, self-declarations etc., cannot be taken into account at all.

These preliminary results has been done with the data available on 21<sup>st</sup> of April 2020.

**Untracked Consumption** = Electricity consumption not explicitly disclosed through tracking instruments such as Guarantees of Origin.

**Note:** CO<sub>2</sub> and radioactive waste figures reported are destined for purposes of electricity disclosure only (rf. page 2).

**Data Sources:** Information reported by national Competent Bodies; Association of Issuing Bodies (AIB); Eurostat

## Graphs with detailed calculations results

Figure 1: Residual Mixes 2019

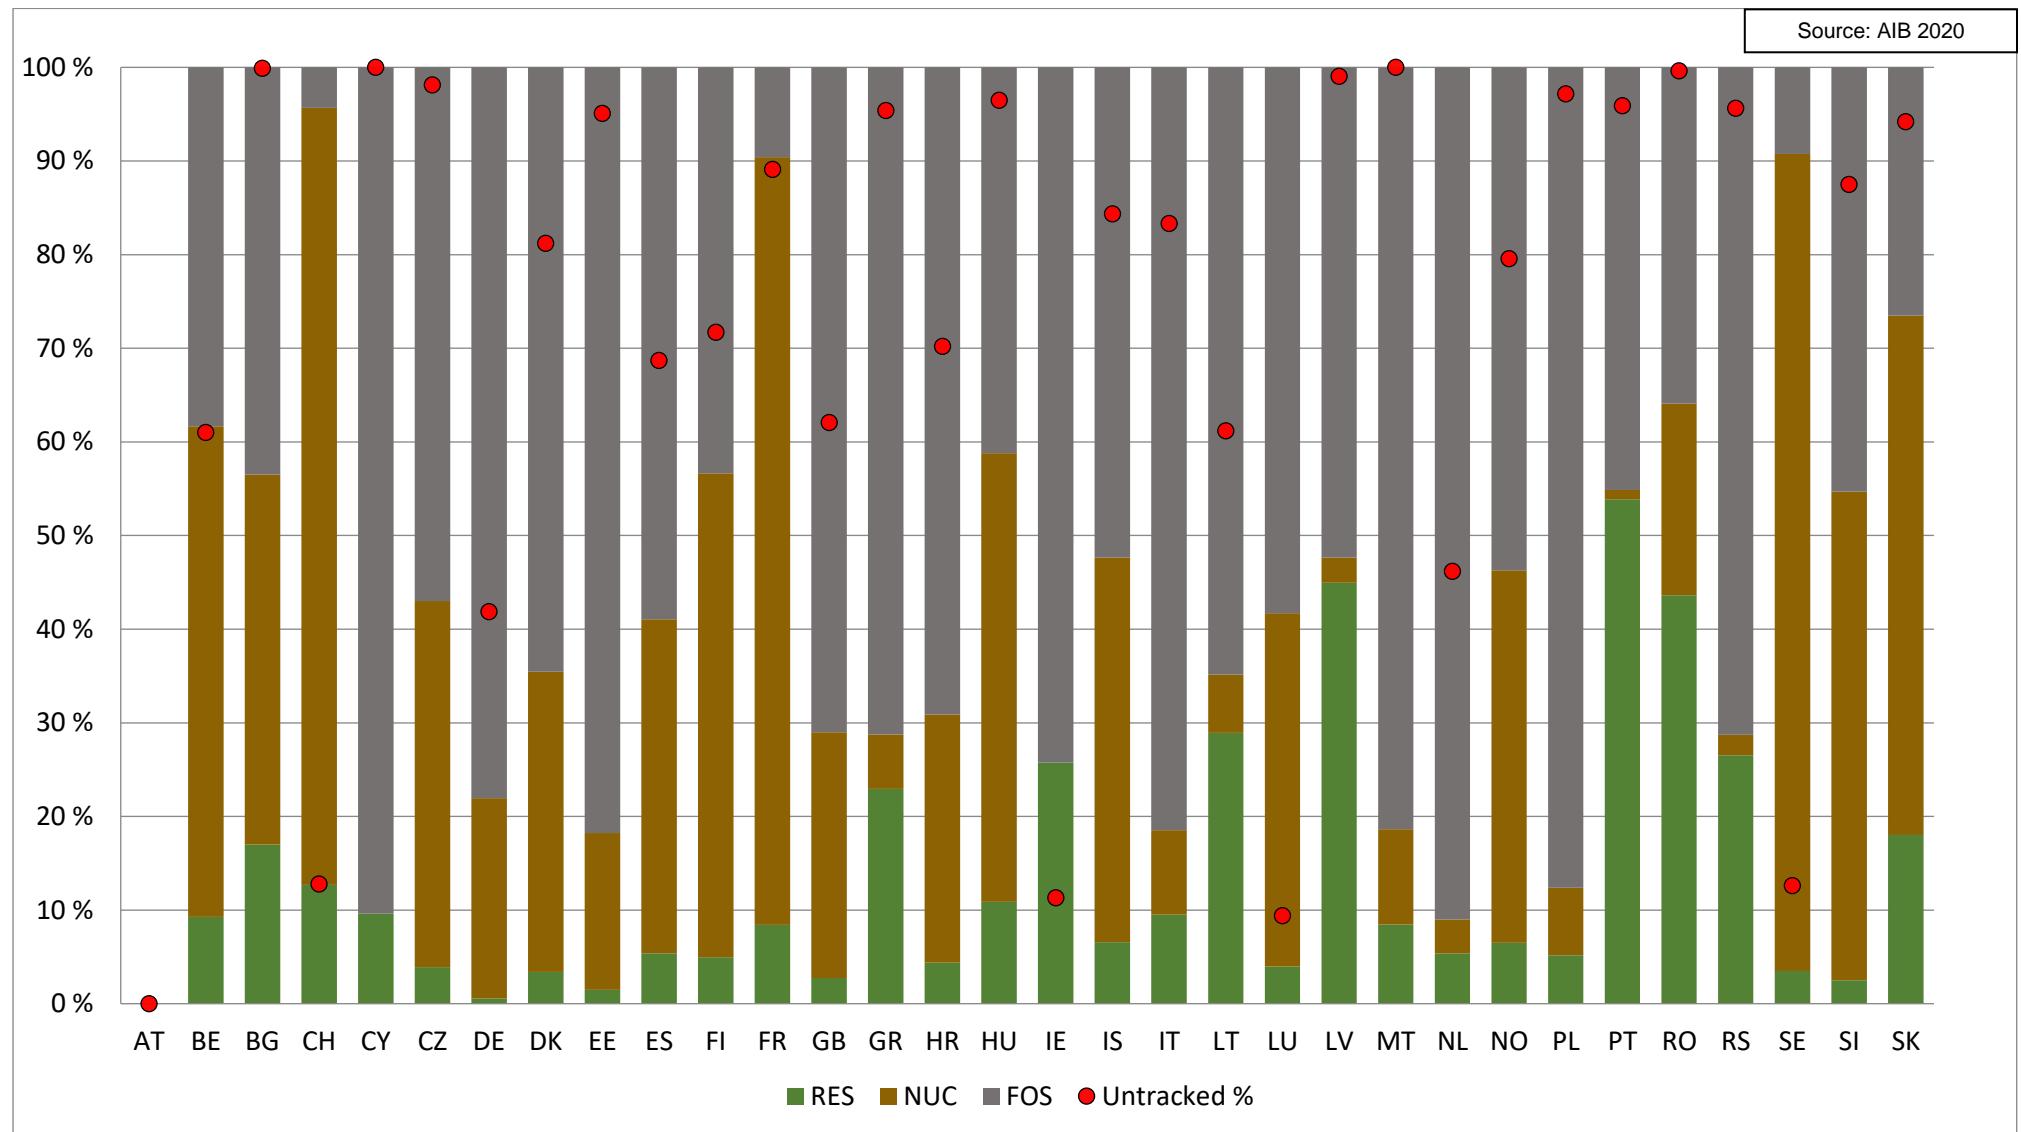

Figure 2: Residual Mixes 2019 (detailed fuel categories)

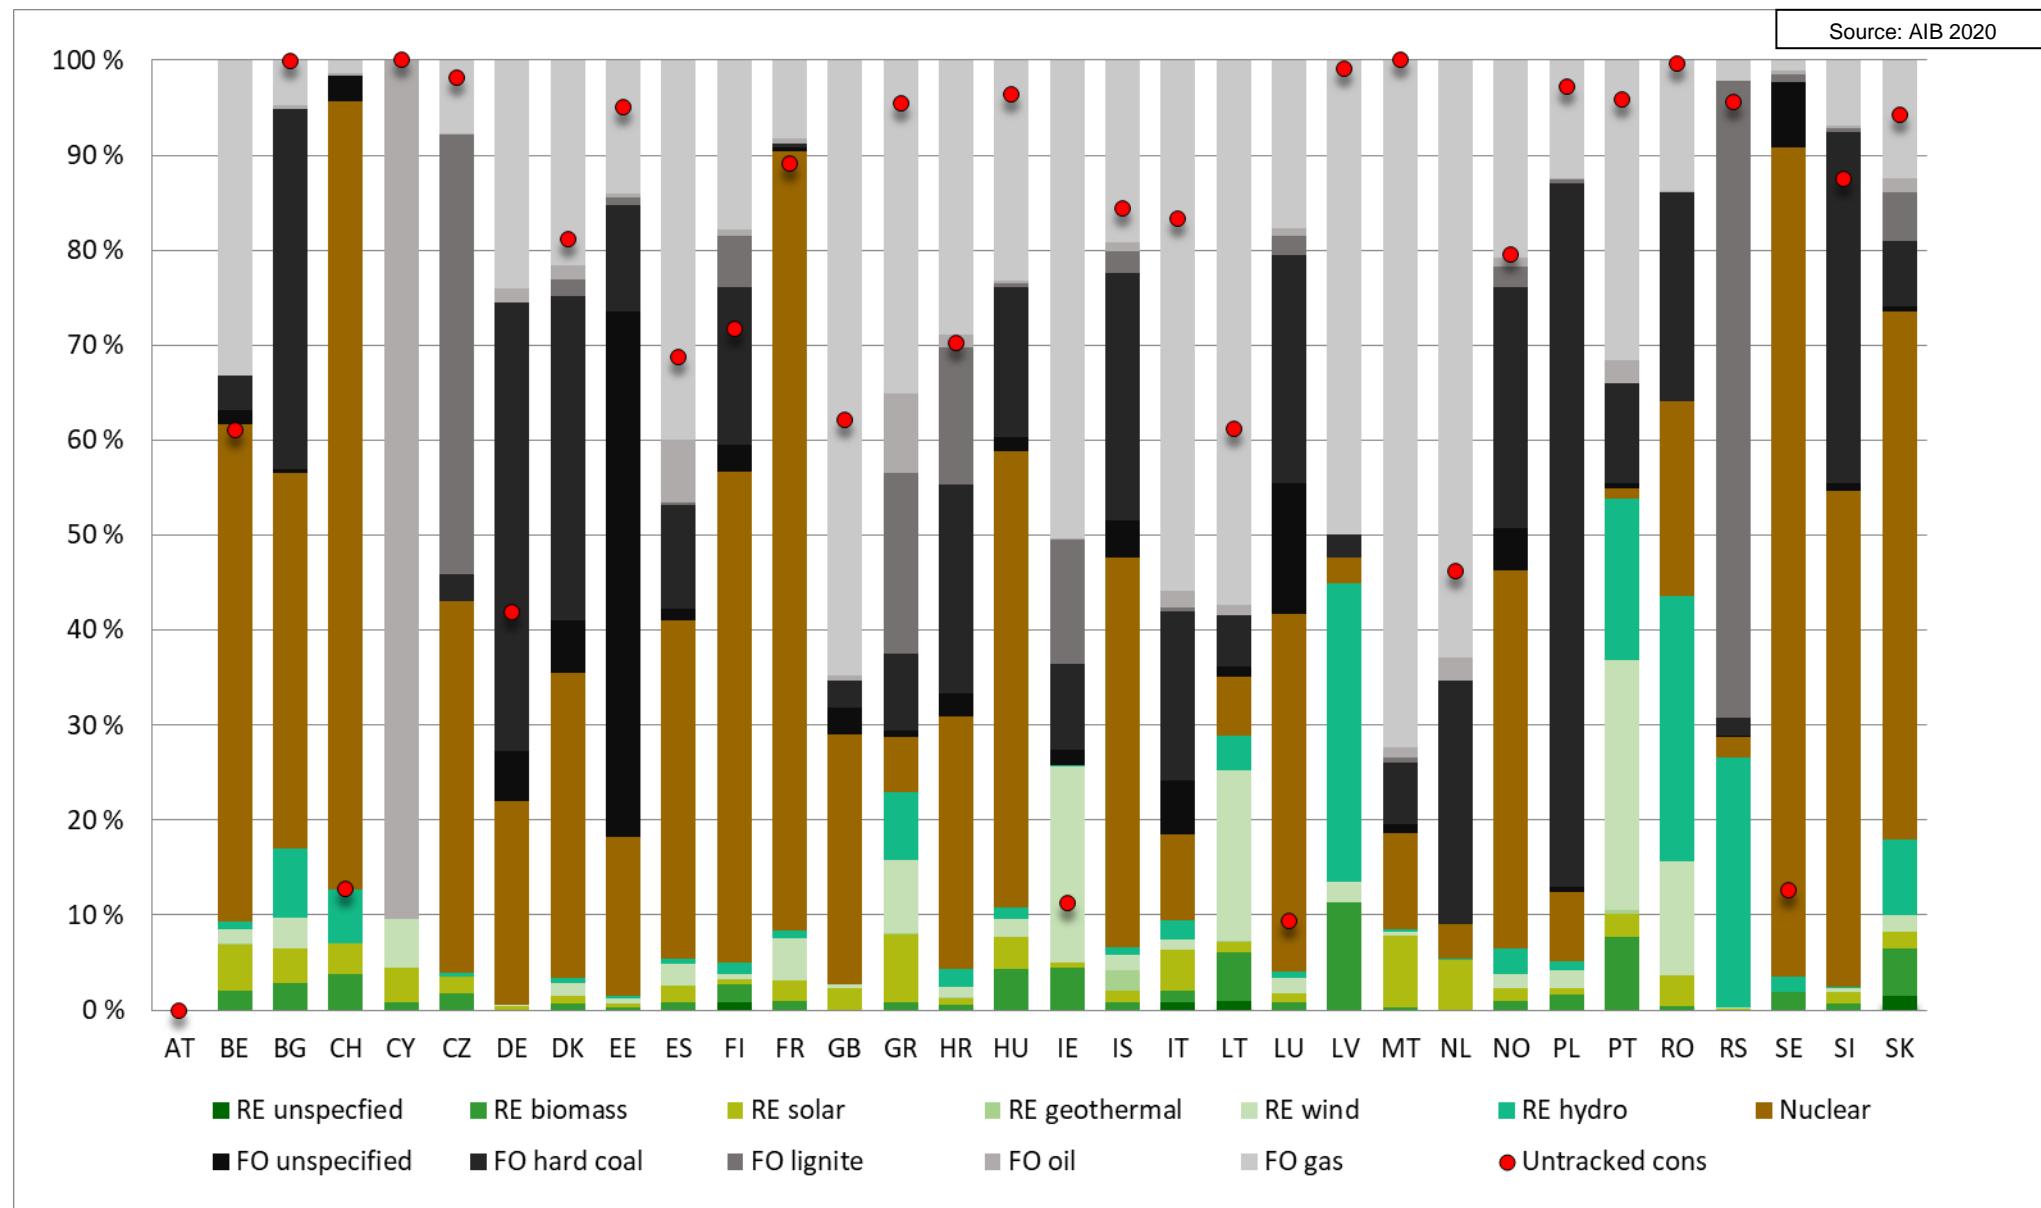

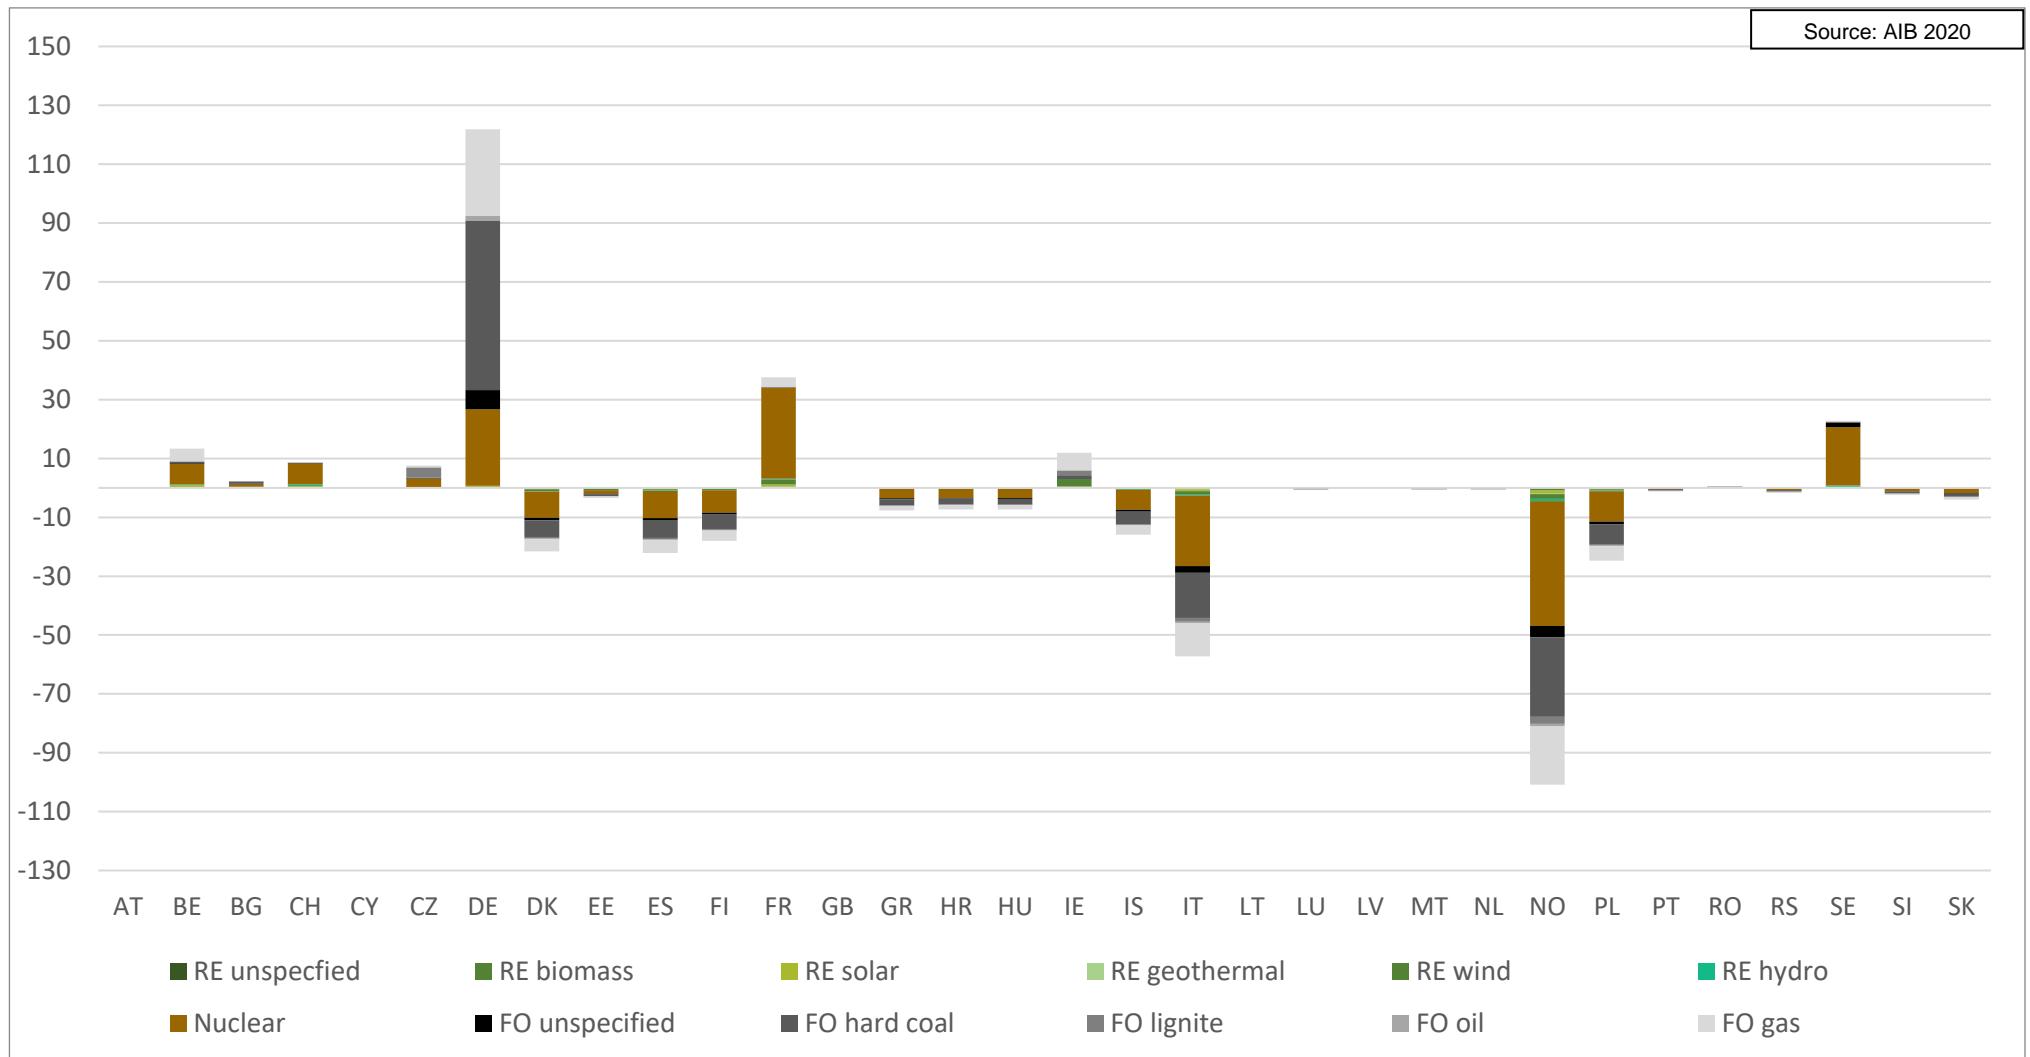

Figure 3: Attributes [TWh] to(positive)/from(negative) the European Attribute Mix 2019<sup>4</sup>

<sup>4</sup> In this figure, the renewable energy added to the EAM does not equal the renewable energy taken out of it, which may seem peculiar. There are two reasons for it: 1) temporal attribute deficit caused by issuing volumes being higher than cancellation volumes, and 2) some countries have negative renewable energy balance in domestic residual mixes (caused by variation in disclosure periods and GO lifetimes overlapping two disclosure periods). This negativity is transferred into the EAM before considering the domestic residual mix attribute surpluses and deficits.

Figure 9: Production Mix (left) and Total Supplier Mix (right) 2019

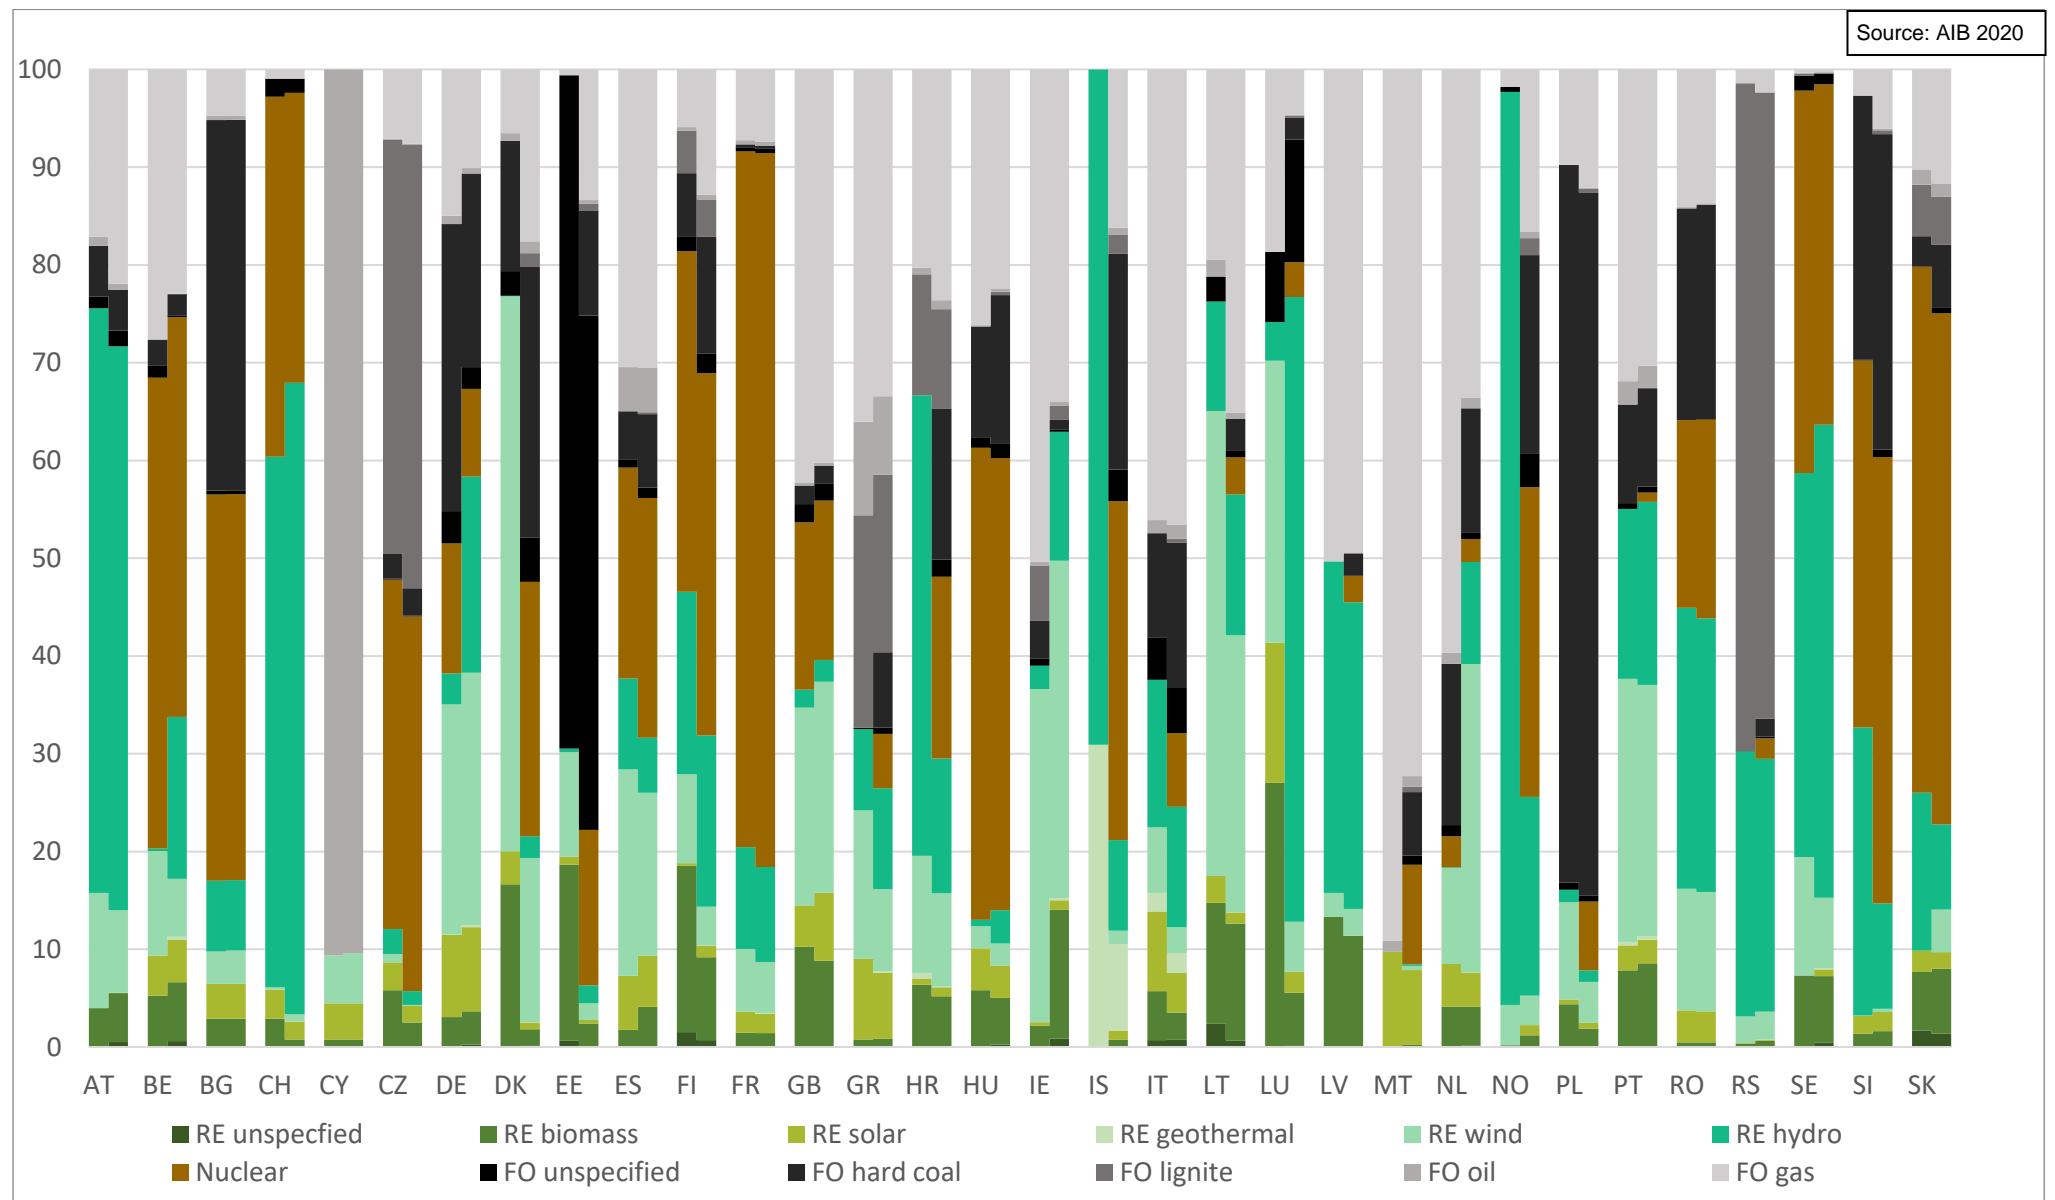

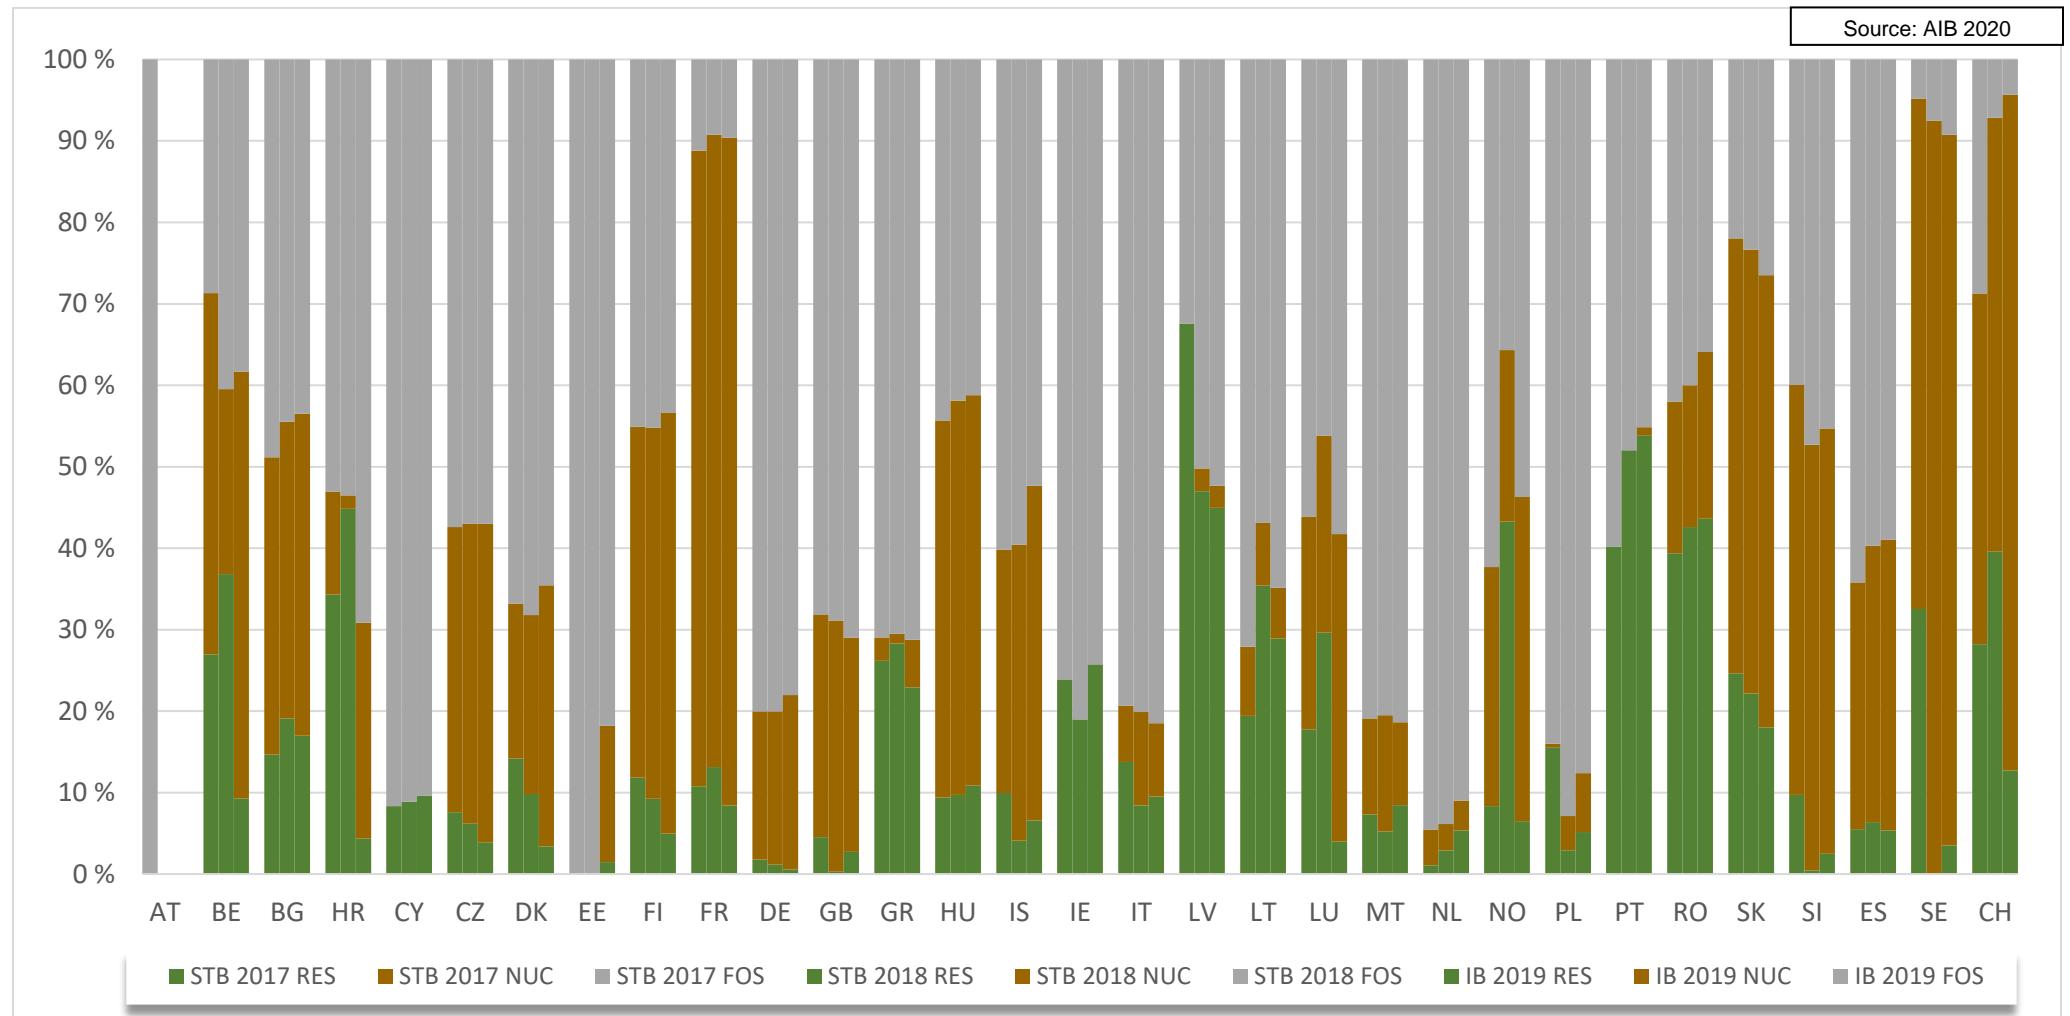

Figure 10: Residual Mixes 2017, 2018 and 2019<sup>7</sup>

<sup>7</sup> The years are not completely comparable because of a methodology change. Years up to 2018 are calculated with the Shifted Transaction Based method (STB) and starting from year 2019 the methodology was changed to Issuance Based method (IB).

## Annex 1: Fuel Categories

Table 8: Fuel category breakdown

Fact Sheet 5 compliance	Fuel code	Fuel description (including all subcategories)	Sub-table reference	
Renewable	Unspecified & Other	F01000000 Renewable - Unspecified		T1 Hard coal sub-categories
		F01040300 Renewable - Heat - Aerothermal		0 F0201010 Unspecified
		F01040400 Renewable - Heat - Hydrothermal		1 F0201010 Anthracite
		F01040501 Renewable - Heat - Process heat - Biogenic		2 F0201010 Bituminous coal
		F01050000 Renewable - Mechanical source or other - Unspecified		3 F0201010 Coking coal
	Solar Wind Hydro & Marine Geothermal	F01040100 Renewable - Heat - Solar		4 F0201010 Coke-oven coke
		F01050100 Renewable - Mechanical source or other - Wind		5 F0201010 Lignite coke
		F01050200 Renewable - Mechanical source or other - Hydro & Marine		
		F01040200 Renewable - Heat - Geothermal		
		F01010000 Renewable - Solid		
Nuclear	Biomass	F01020000 Renewable - Liquid		T2 Brown coal sub-categories
		F01030000 Renewable - Gaseous		0 F0201020 Unspecified
		F03010100 Nuclear - Solid - Radioactive fuel		1 F0201020 Sub-bituminous coal
		F02000000 Fossil - Unspecified		2 F0201020 Lignite
		F02010000 Fossil - Solid - Unspecified		3 F0201020 Brown coal briquette
	Hard Coal	F02010400 Fossil - Solid - Municipal waste		4 F0201020 Peat briquette
		F02010500 Fossil - Solid - Industrial and commercial waste		
		F02020000 Fossil - Liquid - Unspecified	T4	
		F02030000 Fossil - Gaseous		
		F02040000 Fossil - Heat		
Fossil	Unspecified & Other	F02010100 Fossil - Solid - Hard coal	T1	
		F02010300 Fossil - Solid - Peat		
		F02010200 Fossil - Solid - Brown coal	T2	
		F02030100 Fossil - Gaseous - Natural Gas		
		F02020200 Fossil - Liquid - Natural gas liquids		
	Natural Gas	F02020100 Fossil - Liquid - Crude oil		
		F02020300 Fossil - Liquid - Petroleum products	T3	
	Oil			T3 Petroleum products sub-categories
				0 F0202031 Unspecified
				1 F0202031 Ethane
				2 F0202031 Naphtha
				3 F0202031 Aviation gasoline
	Gasoline			4 F0202031 Motor gasoline
				5 F0202031 Aviation turbine fuel
				6 F0202031 Other kerosene
				7 F0202031 Gas and diesel oil
				8 F0202031 Fuel oil low-sulphur
	Gasoline			9 F0202031 Fuel oil high-sulphur
				10 F0202031 Liquid petroleum gas
				11 F0202031 Orlimulsion
				12 F0202031 Bitumen
				13 F0202031 Lubricants
	Lubricants			14 F0202031 Petroleum coke
				15 F0202031 Refinery feedstock
	Gasoline			T4 Gaseous sub-categories
				0 F0203001 Unspecified
				20 F0203021 Coal-derived gas
				21 F0203021 Coal-derived gas
				22 F0203021 Coal-derived gas
	Coal-derived gas			30 F0203031 Petroleum products
				31 F0203031 Petroleum products
				32 F0203031 Petroleum products
				33 F0203031 Petroleum products
				34 F0203031 Petroleum products
	Petroleum products			35 F0203041 Municipal gas plant
				50 F0203051 Process gas
				51 F0203051 Process gas
				52 F0203051 Process gas
				53 F0203051 Process gas
	Petroleum products			54 F0203051 Process gas
				55 F0203051 Process gas
